

## Periodic Words (periodicwords)

A string  $s$  is said to be *periodic* if there exists a string  $t$  such that  $s$  can be obtained by concatenating multiple (at least 2) copies of  $t$ . In other words,  $s$  is periodic if  $s = t + t + \dots + t$  for some string  $t \neq s$ , where  $+$  is the string concatenation operation.

You are given a string  $A = \overline{a_0 a_1 \dots a_{N-1}}$  of length  $N$  and  $Q$  queries of the form  $l_i, r_i$ . For each query, determine whether the substring  $A[l_i \dots r_i] = \overline{a_{l_i} a_{l_i+1} \dots a_{r_i}}$  is a periodic string.

 Among the attachments of this task you may find a template file `periodicwords.*` with a sample incomplete implementation.

### Input

The first line contains an integer  $N$ . The second line contains a string  $S$  of length  $N$ . The third line contains an integer  $Q$ . The next  $Q$  lines contain the values  $l_i, r_i$ , describing the queries.

### Output

For each query, print YES if the required substring is a periodic string or NO if it is not.

### Constraints

- $1 \leq N, Q \leq 100\,000$ .
- $0 \leq l_i \leq r_i \leq N - 1$ .
- The string consist of lowercase letters of the English alphabet.

### Scoring

Your program will be tested against several test cases grouped in subtasks. In order to obtain the score of a subtask, your program needs to correctly solve all of its test cases.

- **Subtask 1** (0 points)      Examples.  

- **Subtask 2** (10 points)       $N, Q \leq 100$ .  

- **Subtask 3** (20 points)       $N, Q \leq 1000$ .  

- **Subtask 4** (20 points)       $N, Q \leq 10\,000$ .  

- **Subtask 5** (50 points)      No additional limitations.  

## Examples

input	output
14 abacbaabcabccc	NO
5	NO
0 13	YES
0 3	YES
6 11	NO
11 13	
6 10	

## Explanation

In the **first query**, it is asked if the whole string is periodic, so the answer is NO.

In the **third query**, the substring *abcabc* is periodic, as it can be obtained by concatenating *abc* twice.
